

Landscape Materials

Frost protection during Winter and Early Spring

Germination Fabric

Increases seed germination as much as 15%

Our white non-woven polypropylene material provides frost protection during winter and early spring. The fabric breathes allowing air flow while retaining precious ground heat. It will not burn foliage. A common complaint with white plastics. Design allows for rain absorption and natural benefits.

Product Advantage:

Manufactured from a light-weight permeable fabric that allows seed and plantings to safely enjoy nature's benefits without harm. It doesn't need to be removed during sunny days. Fabric can be joined for wider widths when required. With proper storage the fabric can be used up to six seasons or more. Custom sizes are available. Don't let your customer suffer the cold.

Fabric Swatch attached.
